EXHIBIT A

Origin and Breeding History of the Variety

1977-79. The Northrup King soybean research group at Washington, Iowa made the cross 'B216' x 'A2575' and advanced the population to F_6. In September, 1979, we harvested 100 random plants and threshed them individually.

1980. We grew each of the 100 plant selections in an F_7 progeny row. One of these, numbered W003747, was selected on the basis of agronomic appearance to be tested in a preliminary yield trial. This line was subsequently named S29-20.

1981-84. We tested S29-20 in replicated yield trials at several mid-western locations and found it to yield well in comparison to other Group II varieties. We identified and confirmed the descriptive characteristics purple flowers, grey pubescence, brown pods, yellow hila, and dull seedcoat luster. We tested S29-20 for resistance to Races 1, 2, 3, 4, and 7 of Phytophthora megasperma by inoculation of detached cotyledons and found it to be resistant to Races 1 and 2. We tested it for reaction to iron-deficiency chlorosis on calcareous soil in Northwest Iowa and found it to be moderately resistant.

In 1984 we initiated seed increase from 500 grams of carefully hand rogued seed. We removed all plants not conforming to the variety description by roguing the increase block several times. Growth and maturity were uniform.

1985-86. We continued to test S29-20 in advanced yield trials to confirm descriptive characteristics and performance.

We grew Breeder Seed of S29-20 in 1985 from the initial increase made in 1984. The field was rogued several times. We produced Foundation Seed of S29-20 in 1986. The Iowa Crop Improvement Association inspected the production fields and found them to meet the requirements for Foundation Seed. S29-20 was approved for eligibility for certification by the National Soybean Variety Review Board on December 11, 1986.

S29-20 is a stable and uniform soybean variety. We have observed no variants in six years of testing and three years of seed increase other than minor, environmentally induced variation normally encountered in a soybean variety.

We will maintain varietal purity by use of progeny rows as needed.

EXHIBIT B

Novelty Statement for the Variety

Soybean variety S29-20 is most similar to A2943. It can be differentiated from A2943 on the basis of hilum color. S92-20 has a yellow hilum. A2943 has an imperfect black hilum.

Additional Description of the Variety

Soybean variety S29-20 is a late Group II cultivar maturing between S27-10 and S30-31. It exhibits short hypocotyl reaction when grown in 4.5 inches of sand at 77° F for 14 days. It is moderately resistant to iron-deficiency chlorosis on calcareous soil.

EXHIBIT E

Statement of the Basis of Applicant's Ownership

Soybean variety S29-20 was developed by the Northrup King Co. soybean breeding staff from germplasm sources cited in Exhibit A of this application. Northrup King Co. believes that the variety is novel as defined in the Plant Variety Protection Act and, therefore, that Northrup King is the sole owner of the variety.
